E4 Week 4: Library flow (file selection, validation, errors)

Goal

A user can add documents, see whether each one is valid, see progress, and understand failures without using the terminal.

What I did

I used Open WebUI's built-in document library (the "Knowledge" feature) as our Library flow. I made a knowledge base called "Document Library" and tested it with one good file and one bad file.

Good file (valid PDF)

- Uploaded a real PDF (`RAG DOc.pdf`, about 593 KB).
- It uploaded with a progress indicator, processed successfully, and is listed in the library with its name, size and timestamp.

Bad file (invalid PDF)

- Made a fake PDF by renaming a text file to `badfile.pdf`.
- Open WebUI tried to process it, failed, and showed the error "Stream has ended unexpectedly" in the UI. The file was **not** added to the library.

Result

Acceptance item	Status
User can choose files	Done
User sees the validation outcome (good file succeeds, bad file fails)	Done
User sees progress during upload/processing	Done
Failures are clear in the UI, no terminal needed	Done
Demo: good PDF + bad PDF → correct UI behavior	Done

Notes

- This uses Open WebUI's own ingestion as a stand-in for our pipeline (the week's deliverable allows stable integration mocks). Validation, progress and errors come from Open WebUI, not yet from E2's `validate()`.
- E3 now exposes `library.status | review | publish | rollback | integrity` and `answering.ask` on `dev_host.py` (port 8765), with the contract in `app/document-qa/backend/secure_qa/library/wire/README.md`.
